

# AUSTRALIAN TOILETS

## The Real Story

### MIDDLE OF THE ROAD

Inland Australia lacks essential public toilet facilities for cross-country-travelers, with many missing key hygiene amenities like showers, parking, and dump points. Upgrading and increasing these facilities is vital to support basic hygiene needs for road users

### TOILETS ≠ DISEASE

Our study found no strong link between toilet availability and disease presence, but coastal population density may overshadow potential relationships in less dense areas like Central Australia. Further research is needed before changes can be made.

### TOILET FUMES?

While toilets had little impact on water pollution, they were linked to air and land pollution, with land pollution being a significant concern. To address this, thorough and ongoing inspections of waste disposal methods are essential when constructing or upgrading toilets.

### TOO MANY TOILETS

Central Australia lacks unisex toilets, missing an opportunity for inclusive and efficient design. Future facilities in this region should prioritize unisex designs to ensure universal access for all gender identities and decrease the construction of facilities.
